

The main gate from the basilica of the fortress at Potaissa (summary)

The archaeological researches at the fortress of the V-th legion Macedonica from Potaissa revealed the building of the headquarters (*principia*) and in the *basilica* several archstones. These are from the round arches of the entrance gates of the basilica from the inner yard of the building. The dimensions of the archstones prove that the wall of the basilica was 4 *pedes* wide. Calculations permitted the reconstruction of a gate having an opening of 611,52 cm (21 *pedes*), the arch having 20 archstones and a keystone.
